

TICKO.IO

Decentralized ticketing platform and airline management system

What is TICKO.io?

TICKO.io is the first decentralized platform for the airline industry. It combines aviation management automation with a ticket distribution system. The platform works as a general passenger service and provides flexible solutions by leveraging Smart Contracts.

TICKO.io use cases:

Passengers will use the platform as a flight search engine to browse and find the best offers provided directly by the airlines. They can make instant bookings without extra fees and are able to receive all the organizational information directly from the service provider, no intermediaries needed.

Airlines will use the decentralized platform as a general passenger service system as well as an efficient ticket distribution mechanism. They can instantly set flight schedules, track airplane status and history, manage fare tariffs, keep track of passenger reservations and records in a manner that is provably secure and free of human error.

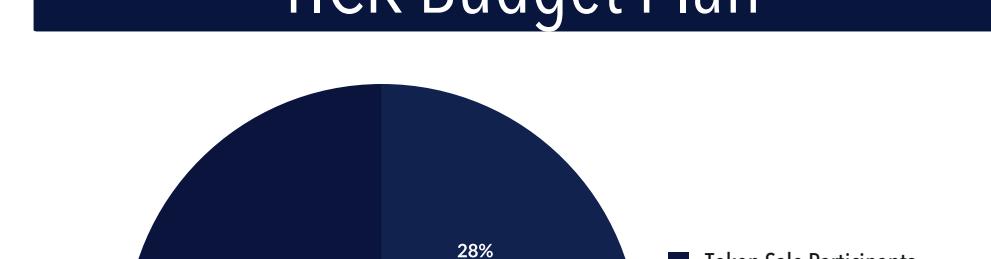

TICKO.io aims to:

- 1 ➤ Add certainty and predictability to the aviation industry.
- 2 ➤ Streamline flight management, scheduling & operations.
- 3 ➤ Connect airlines & passengers in a single ecosystem.
- 4 ➤ Design an architecture for further growth and development.
- 5 ➤ Provide instant market signals to all participants.
